### **Hacker Tools**

August 14, 2024 Ramasamy Kandasamy

### 1. Command Line Tools

### Files & Directories

cd	Change directory.
pwd	Print working directory
ls	Options: -Ralh
tree	List in tree form. eg: tree dir
touch	Creates text file.
mkdir	Make directory
mkdir -p	Make directory and necessary parent dir.
ср	Copy files.
mv	To move files and rename files.
rm	Remove files permanently.
rm -i	Remove files interactively.
rm -r, rm -R	Remove files recursively. Use to delete folders.
rm -f	Force delete.
basename	Removes folder name from path and optionally suf-
	fix.
-s	Remove suffix. eg: basename -s .fastq $< path >$
~	Home directory, aka \$HOME.
./ ,/	Relative paths to current and parent dir.
/dev/null	Fake file, black box.
chmod 777	r-4,w-2,x-1. User, group,all.
chmod xyz	Eg chmod u+w.
	x = u : user, g : group, a : all.
	y = + : add, - : remove.
	z = r : read, w : write, x : execute.
du -h dir	Gives size of all directories in dir
du -sh $dir$	Gives size of dir.
df -h	Gives information about disk usage.

### File compression

tar	Tape archive
-cf	To make tar file form a directory tar -cf dir.tar dir.
-tf	View contents of an archive.
-tvf	View contents, verbose.
-xf	extract.
zip -r	Compress. zip -r file.zip dir
unzip -l	View contents. unzip -l file.zip
unzip	Decompress. unzip file.zip
gzip	Eg: gzip filename. gzip can only compress a file and not a directory. To compress a directory first make a .tar file and then compress that.
gunzip	To unzip .gz files.
-c	Output to standard output.
	Eg: gzip -c file1 > file.gz. Eg: gzip -c file2 >>
	file.gz. and gunzip -c.
bzip2	Works like gzip. Higher compression, but slow. File ex-
	tension .bz2

TODO: chown, chgrp. compress/uncompress. Also: zgrep, zcat, zless, zdiff rsync hexdump, checksums, diff (in text processing?).

#### **Process Execution**

Process Execution		
Cmd1 ; Cmd2	Run Cmd2 irrespective of exit status of Cmd1.	
Cmd1    Cmd2	Execute Prog2 only if Prog1 has failed (non-zero	
	exit status).	
Cmd1 && Cmd2	Execute Prog2 only if Prog1 has succeded (zero	
0mu1 ww 0mu1	exit status).	
(;)	,	
	colon are processed independently and piped in	
	parallel to next step.	
<()	Process substitution, like anonymous named pipe.	
	Eg: programin1 <()in2 <() .	
>()	Write output to anonymous named pipe. Eg:	
	programout1 >()out2 >().	
xargs	Execute command from stdin. Examples:	
	$Apply \ wc \ on \ each \ file.$	
	ls *.txt   xargs wc	
	Apply we on each file, using placeholder.	
	ls *.txt   xargs -I {} wc {}.	
	List all files in each dir, with the dirname. [Two	
	ways.	
	ls   xargs -I {} sh -c 'echo {}; echo	
	""; ls {}'	
	ls   xargs -I {} sh -c 'echo \$1; echo	
1	""; ls \$1' _ {}	
 tee	Pipe Eg: prog1 in.txt   tee intermediate.txt	
tee	$\mathrm{Eg:}$ prog1 in.txt   tee intermediate.txt   prog > result.txt	
mkfifo	Create a named pipe. Eg: mkfifo fqin. Treat	
IIIKI 110	named pipe like any other file. But the input and	
	output is piped. While using named pipe nothing	
	is written on the disk.	
nohup	Run a program without interruption.	
&	Run in background. eg: nohup prog1 &	
>, >>	Write and append, respectively, standard output	
	to a file.	
2>, 2>>	Write and append standard error to a file.	
2>&1	Redirects std.err to std.out.	
<	Take input.	
/dev/null	Eg: foo > /dev/null, the output is not printed.	
Process mangement		
jobs	List all jobs. Use id in [] to bg,fg,kill.	
	Bring a job to foreground.	
-	Resume a suspended process in the background.	
	Pause a running job.	
	Kill a running job.	
	Dod - tol	

### $\mathbf{Etc}$

find	Find file/directories.
	Pattern: find <dir> <iname name=""> "<patttern>"</patttern></iname></dir>
	${ m Eg:}$ findiname "*deviceQuery"
?,*, [A-Z]	Wild cards.
{}	Expands combinatorially.
	Eg: \$ mkdir mm10-{chr1,chr2,chr3}
\$()	Eg: echo "\$()"
	Eg: mkdir results-\$(date +%F)
	Eg: $$$ today = "date + $%$ F".

#### Terminal customization

TODO: export, \$PATH, source

Display tasks and system resource usage.

Exit status,=0 when a program exits without an error.

User friendly tool to view running processes and re-

kill

top

htop

echo \$?

End a job.

source utilization.

### 2. System Tools

df -h View usage of all the mounted disk.

### 3. Networking

wget url	Download file from http or ftp.
accept, -A ""	Only download files matching this criteria.
	Eg "*.fastq"
reject, -R	Similar to above
no-directory, -nd	Don't download directory structure. Only
·	files.
recursive, -r	
no-parent, -np	Don't move above parent directory. This
	is important to avoid downloading unnec-
	essary data.
-0	Output filename.
-e robots=off	To not want wget to follow 'robot.txt'.
	See: This answer
Other options: -limit-rat	e, -user=user, -ask-password

Curl can also download form SFTP and SCP. Also checkout RCurl and pycurl.

Redirect output to file.

Download ultimate page and not the redirect

download to file.

rsync	Usage: rsync source destination.
-r	Recursive to copy directories. Book doesn't use this. But
	I had to use this when I use rsync with pendirve.
-a	Enable archive mode.
-z	Enable file transfer compression.
-v	Make progress verbose.
-e ssh	If one of the directory is in remote host then have to use
	this option.Eg: \$ rsync -e ssh ./dir/ url:/home/

Trailing slash in the source in rsync is meaningful. Eg rsync ./dir/copies the contents of dir wherease rsync ./dir copies the entire directory. Rsync is use to synchronize directories but if you want to just copy one file then scp is enough. eg:

\$ scp file url:/home/...

curl url > file

curl -0 <file>

-L,--location

#### Checkout Aspera Connect, ncbi sra-toolkit

CHOCHOUT I	espera comices, near ara tecinic
shasum	Calculate checksum using SHA-1. Can be used to find
	checksum of many files and store the result in a text file.
	Eg: shasum *.fa > chksm.sha
-c	Validate the files. Eg: shasum -c chksm.sha.
sum	Checksum program used by Ensemble.
diff -u	Outputs a diff file that shows difference between two files.
	Eg: diff -u file1 file2
	shasum -c sum

### 4. Working with remote machines

### 4.1. SSH

• Usage

\$ ssh host

\$ password:

• Examples of host

192.162.82.120

bioclust.myuniversity.edu darwin@192.162.82.120 darwin@bio.univ.edu

• Options

-v verbose. Verbosity can be increased by: -vv or -vvv.
 -p port. Eg: ssh -p 5043 cdarwin@bio.univ.edu
 Default port is 22

 Using alias: To use alias create the file ~/.ssh/config and store server as info as below. Host bio\_serv

HostName 190.512.171.29

User cdarwin Port 50434

Also applies for Rsync and scp

• SSH keys: SSH key to connect without password. Eg: \$ ssh-keygen -b 2048

This command request the following:

- File to save the key. By default this is: /Users/username/.ssh/id\_rsa NOTE: This file is the private key.
- Passphrase:
   Not necessary but good to use.

Private key: /.ssh/id\_rsa
Public key: /.ssh/id\_rsa.pub

\$ chmod 400 id\_rsa # restrict access to private key

\$ ssh-add

### 4.2. Establishing a server

Use "Open SSH":

https://help.ubuntu.com/lts/serverguide/openssh-server.html

My IP address: hostname -I

List of logins to the server: sudo less /var/log/auth.log

### 4.3. nohup

nohup runs program un-interupted.

The execution continues even when the terminal is closed or connection to remote machine is lost.

• Just add nohup just before the command. Eg: nohup prog1

• Usually nohup is in the background. Eg: nohup prog1 &

Unfinished: Tmux.

### 5. Text processing

echo	Process and print whatever follows.
echo -e	enable backslash escapes like \ \t, \n
cat	Takes standard input or input from file and gives stan-
	dard output.
cat -n	Output with line numbers.
head -n x	Print first x lines. Default: 10 lines.
tail -n y	Print last y lines.
WC	Word count. Outputs number of words, lines and
	characters.
wc -l	Outputs only number of lines.
tr	Translate. Eg: tr ':' '\t'.
less	Pager. Commonly used commands:
Space	Next page.
Ь	Previous page.
g	First line.
G	Last line.
j	Down (One line at a time).
k	Up (One line at a time).
/ <pattern></pattern>	Search down for a pattern.
<pre>?<pattern></pattern></pre>	Search up for pattern.
n	Repeat last search downward.
N	Repeat last search upward.
cut	To extract specific columns.
-f x	Extract columns x.
-f x-z	Extract range of columns.
-f w,x-z	Extract w and x-z. Cut cannot reorder column.
-d	Specify delimiter eg: -d",". Default delimiter is tab.
column -t	To visualize columns of data. Usually data is piped
	to column -t.
-s	Specify delimiter using -s",". Default: tab.

grep	Use as grep " <pattern>" file. Quotation around the pa</pattern>
	ter is not necessary but it is safe. If the pattern contain
	quote then use single quotes eg: grep '"'.
-i	Case insensitive.
-E	To use regular expressions in grep.
^	Look for pattern in the beginning of line. Eg: "^#"
-M	Matches the entire word surrounded by space.
-v	Returns only lines that do not match the pattern.
-0	Return the exact matching pattern.
-c	Count how many lines match a pattern.
-B1	Print one line of context before the matching line.
-A2	Print two lines of context after the matching line.
-C	Context before and after the matching line (Doesn't work'

sort	Sorts alphanumerically by line.
-ka,b	Sorts w.r.t to columns a to b.
-k2,2n	Treats columns 2 as numeric and sorts w.r.t to
KZ, ZII	columns 2.
-t	Specify delimiter eg: -t",". Default = tab.
-s	Stable sort. Do not reorder lines in file if the sort rank
_ <b>5</b>	is equal.
_	•
-c	Check if the file is already sorted.
-r	Reverse sort.
-V	Understands numbers inside string. Eg chr22.
-S	Specify memory to be used.
	Eg: -S 2G # Use 2 GB,
	-S 50% # Use 50% of memory.
parallel	to use parallel processing.
uniq	Usually used along with sort as: sort   uniq.
-i	Case insensitive.
-c	Count occurences next to the unique lines.
-d	Return line with duplicates.
join	Combine data based on a common column. Eg:
	join -1 a -2 b file1 file2. a and b represent two
	columns common to file1 and file2.
-a	If some elements of common column are missing from
	one file. Use this flag to show all elements of common
	column from superset file.
Theoleout hourd	*

Checkout hexdump

#### 5.1. Awk

END{...}

Format: awk pattern {action} input1.txt input2.txt awk -f file.awk input.txt. Record = row. Column = fields. Input field separator. -F Eg:input.txt. Defaule field separator = tab. -f Take input from file. Eg: awk -f file.awk input.txt. (...) && (...) Use logical operators. See below. \$n /.../ Use regular expression between slashes. /.../,/.../ Specify range. Works only with regex (with double slash). Eg: awk 'BEGIN $\{\ldots\}$  ...  $\{\ldots\}$  END $\{\ldots\}$ ' BEGIN{...}

Awk operations: +,-,\*,/,%,^.

a ... b. Replace "...": ==,!=,<,>,<=,>=,~,!~,&&,||,!a

Field separators: FS,RS,OFS, ORS.

**Awk variables:** NF, NR (Record number accumulates between files.), FNR(Resets record number after every files.).

Example awk script file
awk -f script.awk plasmids.tsv
BEGIN{FS="\t";OFS="\t";x=0}
/[Cc]re/{
x+=1;
print x,\$1,\$2}
END{print "There are " x "plasmids with Cre"}

Checkout BioAwk.
Checkout control flow.

#### 5.2. Sed

sed 's/target/replacement/flag'

- -e to Chain commands. Eg: sed -e 's/:/ $\hat{/}$ ', -e 's/-/ $\hat{/}$ '.
- -E Use extended POSIX.
- g Global flag. Usually sed replaces only the first occurrence in a sentence. Use global flag to replace all occurences.
- i To make the search case insensitive.

### 5.3. Regular Expression

#### Single character meta characters

- . Match any single character.
- [ ] Match any single character between []. Eg: [at] match "a" or "t".
- [^] Match any single charcter except on between [].
- [0-9] Any number between 0 and 9. Eg: 0-3a-cz] equals [123abcz].
- (...) Grouping. eg: (AT)+ or (GLY) {2,}.

#### Quantifiers

- ? Match preceding character zero or one time.
- Match zero or more time.
- + Match one or more time.
- {n} Match n times.
- {n,} Match at least n times.
- {a,b} Match at least a times, at most b times.

#### Anchors

- Match the start of a line.
- Match end of a line.
- \< Match beginning of word.
- \> Match at the end of word.
- \b Match either beginning or end of word.
- \B Match any character not at the beginning or end.

#### Character class

[:alnum:], [:digit:], [:alpha:], [:upper:], [:lower:], [:blank:], [:space:], [:punct:] and [:print:].

Use backslash as escape character.

- $\slash$ s white space character. What it includes depends on the flavour of regex.
- \d Add digits.
- \w Word character, matches [A-Za-z0-9\_]

| as OR logical operator: (GLY|GLN). "one and|or two" is equal to "(one and)|(or two)".

"one (and or) two" is "one and two" or "one or two".

Back references: () : Memorizes the match for regular expression within parenthesis. Use  $\n$  to recall nth match.

### Shell scripting

### **Modifying PATH**

Add a directory to path: Append one of the following files.  $\sim$ /.profile or  $\sim$ /.bash\_profile

with the following line: PATH=\$PATH: <directory> Eg: PATH=\$PATH:\$HOME/scripts

$\operatorname{Header}$		
#!/bin/bash	Shebang	
set -e	Terminates script if there is non-zero exit status.	
set -o pipefail	If a program in the pipe fails the entire pipe returns non-zero exit status.	
set -u	Terminates for undefined variables.	
Variables		
sample="CNTRL"	Assignment, no space around "=" $$	
echo \$sample echo \${sample}_al	n Use curly braces while concatenating a	

mkdir "\${sample}\_aln" Quoting variables prevents commands from interpreting spaces and special vari-

variable with additional text.

echo \${#sample} Length of the variable sample

### Command-line arguments

Script name First argument n<sup>th</sup> argument.

Number of arguments not including \$0.

#### Example:

```
#!/bin/bash
echo "script name: $0"
echo "first arg: $1"
echo "second arg: $2"
echo "There are $# input arguments"
```

#### **Conditionals** 6.1.

#### **Format**

```
if [ <condition-statement> ]
then
if-statements
elif
then
elif-statements
else
else-statements
```

#### Example:

```
if [ $# -1t 3 ]
then
echo "There are less than 3 arguments"
```

#### In bash 0 is true/success, anything else is false/failure

#### String and integer comparison

```
str is null string.
 -z str
                  str1 and str2 are identical.
 str1 == str2
 str1 != str2
                  int1 and int2 are equal.
 int1 -eq int2
 int1 -ne int2
 int1 -lt int2
 int1 -gt int2
 int1 -le int2
 int1 -ge int2
                  Logical OR.
 -0
                  Logical AND.
if conditional can also be used to depend on exit status. Eg:
  if grep "pattern" file1.txt > /dev/null && grep
```

```
"pattern" file2.txt > /dev/null/
echo "found pattern in file1.txt and file2.txt"
fi
```

```
grep "pattern" file1.txt > /dev/null
then
echo "pattern not found in file1.txt"
fi
```

### Testing files and dirs

#### List of test expressions.

```
-d dir
             dir is a directory
             file is a file.
 -f file
             file exists.
 -e file
 -h lind
             link is a link.
             file is readable.
 -r file
 - w file
           file is writable.
 -x file
             file is executable.
Example
```

```
test -d dir ; echo $?
test -d dir1 -o -d dir2: echo $?
```

Exit status would be 0 if the directory dir exists.

#### Example:

```
if! test -d $1
then
mkdir $1
fi
```

Above script is equivalent to the following.

```
if [! -d $1]
then
mkdir $1
fi
```

### 6.2. Arrays and For loop

#### Manual creation

```
$ sample_names=(zmaysA zmaysB zmaysC)
$ echo ${sample_names[0]}
zmaysA
$ echo ${sample_names[@]}
zmavsA zmavsB zmavsC
$ echo ${#sample_names[0]}
$ echo ${!sample_names[0]}
0 1 2
```

### Array creation using command substitution

```
samples=($(cut -f3 samples.tsv))
file_names=($(ls))
```

#### Array of number sequence

```
seq 0 0.1 1 # seq start step end
s=((seq 0 0.1 1))
```

```
(i-1)^{th} element of array.
${arr[i]}
${arr[0]}
                        All the elements of arr.
${#sample_names[0]}
                        Length of arr.
${!sample_names[0]}
                        Returns an array containing the index of el-
                        ements in arr.
```

### 6.3. For loop

```
for name in ${file_names[@]}
process.sh $name
done
for name in ${file_names[@]}: do
process.sh $name
done
for name in ${file_names[0]}; do; process.sh $name; done
for i in $(seq start step_size end);
process.sh $i
done
```

### 6.4. Find, exec and xargs

find Usage: find <folder> -name "<pattern>". Eg: find . -name foo.sh. Find <pattern> using same special characters -name <pattern> as bash (\*,?, [...] ) Identical to -name but case-insensitive. -iname -empty Matches emtpy files and folders. Matches types x (f - file, d - directory, 1 - links). -type <x> -size <size> Matches <size>. Eg: +50M; Files larger than 50 MB Eg: -50M; Files smaller than 50 MB Match regular expression. Use -E for extended -regex POSIX. -iregex Case-insensitive. separate results with null-byte and not new line. -print0 Explain! Logical AND. expr -and expr expr -or expr Logial OR. -not expr Logial NOT. Alternate: "!" expr Group a set of expressions. (expr) -exec Example: find . -name \*.c -exec <prog1>  $\{\}\$ \;. Execute cycle on all the found files. {} represents the found files. Mind the space between {} and \;

### 6.5. Arithmetics

#### let

Examples using let:

```
let x=1 #No space within expression
let x=x*2
let x++
let "x = x + 1" # Space OK within quotation.
```

Examples using expr:

```
expr 2 + 3 # Space is required for expr
a=$(expr 2 + 3)
expr $x + 1
```

 ${\tt expr}$  is simillar to  ${\tt let},$  but only evaluate and not assign value to a variable.

#### Arithmetic operations:

```
+,-,/,%

* Multiplication operator for let
/* Multiplication operator for expr
var++ increment var by 1 used only in let
var-- increment var by 1 used only in let
```

### 7. Git

Setup git with the following commands:

\$ git config --global user.name "Ramasamy Kandasamy"

\$ git config --global user.email ".....@gmail.com"

Next command tells git to use color to indicate changes.

\$ git config --global color.ui true

To change default text editor:

\$ git config --global core.editor gedit

These commands create a .gitconfig file in home directory. Use \$ cat ~/.gitconfig to get current information.

Git command structure: git <subcommand>
git init Initialize git repository in a directory.
git clone To clone a git repository.

Eg:
\$ git clone https://github.com/user/sth.git
\$ git clone https://github.com/user/sth.git dir\_name
\$ git clone https://user@bitbucket.org/user/sth.git

Git consists of untracked files, tracked file , files staged for commit, and files committed to the repository.

git status	Gives three categories of files: untracked, tracked
	files that have been modified, files staged for com-
	mit.
git add	Start tracking a file or stage a file for commit.
-f	To stage a file not tracked, i.e. a file in .gitignore.
git commit	Commits all staged files to repositoryamend
-a	This options tells git to automatically stage all mod-
	ified tracked files in this commit.
-m ""	Message is mandatory. If there is no message, git
	opens text editor to input message. Default text ed-
	itor can be specified in git-config.
git diff	Shows difference between current version and staged
	version. If there are no staged version, shows differ-
	ence between last commit and current versions.
staged	To see difference between staged version and last
	commit.
git reset	Unstage a file. Without a file name all staged files
	get unstaged.
git log	List all commits, commit message SHA-1 checksum
	etc. Options:pretty=oneline,abbrev-commit,
	graph,branches, -n2 : to view only latest two
	commits.
git rm	Use these commands to rename or delete files.
git mv	Using rm and mv will confuse git.
.gitignore	Used to avoid certain files, fastq files for example,
	from being listed in untracked section of git status.
	Eg: \$ echo "*.fa" >> .gitignore.
git ls-tree	List contents of tree object.
	Use to list all files in the latest commit.

To add a remote repository.

Eg: git 1s-tree -r master --name-only

git remote -v	Shows remote repository that connected to local repository.
git remote rm	Remove remote repository. Eg: git remote rm
	origin
git push	Use git push origin master to push main
	branch to origin (remote repository)
git pull	git pull origin master: simillar to above.

Resolving merge conflicts: First git pull from remote repo. git status shows files with merge conflict. Open the file and resolve the conflict using guidlines provided.

#### Unfinished: Github SSH

git checkout	Restores file from HEAD. To restore a file
file	from a specific commit. Use the commit SHA-1 ID.
	Eg git checkout 08ccd3b README.md
git stash	To temporarily store the changes and go back to
O .	HEAD.
	git stash pop to restore changes stored in git
	stash.
git diff	git diff id1 id2 file to compare different ver-
8-1 4-1-1	sion using SHA-1 ID.
	git diff HEAD~3 HEAD~4: w.r.t to last commit.
git commit	To edit message in last commit.
amend	Can also be used to modify files in previous com-
amena	mit, but I don't know how.
git branch	Creates a new branch. It also lists all branches and
	indicate the branch that is used currently.
-d	To delete a branch.
-m	Rename a branch. Eg:
	git branch -m new-branch # Renames current
	branch.
	git branch -m old-branch new-branch.
all	To view hidden branches including remote reposi-
	tories. For eg, /remote/origin/master is usually
	hidden. This functions like an actual branch but
	one cannot develop in this remote branch.
git checkout	To jump between branches. Use branch name that
	you want to jump to.
git merge	To merge two branches go to the branch you want
	to merge to and use git merge <other branch="">.</other>
	Merge conflict can be resolved as described earlier.
	In fact the earlier merge conflict was between a lo-
	cal branch and a remote branch.
git push	New branch from local can be synchronized with
	remote using: git push origin branchname.
git fetch	Used to synchronize my remote branch with remote
	remote repository. Eg: git fetch origin. To in-
	coporate this to local branch use git merge.
NOTE: git pull	l is nothing but git fetch followed by git merge.

 $\underline{\mathbf{NOTE:}}$  git pull is nothing but git fetch followed by git merge. git checkout -b new-methods origin/new-methods

This command simultaneously creates and swithces a new branch using -b option. This local branch will push and pull to this specific remote branch.

git remote prune origin : To prune a stale branch in /remote branch.

### 8. Vin

Motion Usage: <num> <motion>

TVICTION CDUE	50. 11411. 111001011.
h 1	One character left or right.
j k	One line up or down.
w b	One word forward or backwarks.
е	Simillar to w but keeps the cursor at the end of the word.
0	Cursor to the begining of the sentence.
\$	Moves cursor to the end of the sentences.
G	End of the file.
gg	First line.
H	Top of screen.
M	Middle of screen.
L	Botom of screen.
<num>G</num>	Go to line <num>.</num>
$[\mathtt{Ctrl}] + \mathtt{f}$	One screen forward.
$\boxed{ t Ctrl} +  t b$	One screen backward.
$ exttt{Ctrl} +  exttt{G}$	View position in the file.
[Ctrl] + 0	Go to where you came from .
$\boxed{ t Ctrl} + I$	Opposite of $\boxed{\mathtt{Ctrl}} + \boxed{\mathtt{0}}$
%	Go to the corresponding opening or closing parenthesis.

O:	pe	ra	to	ne
v	pe.	ra	ιU	1.5

i	INSERT mode
a	append, goes to insert mode
a	append from the end of the line.
v	visual selection, selection is stored in clipboard
0	open a line below
0	open a line above
Esc	Go to command mode
d	delete and also cut, $\equiv$ Ctrl + X
dd	delete whole sentence
x	delete character under the cursor
r	replace the character under the cursor
R	replace until Esc
С	change: works equivalent to d followed by i
У	yank, copy
p	paste
u	undo most recent edit
U	undo all the changes in the line
$ exttt{Ctrl} +  exttt{R}$	Redo
Conv. posto	hoolemank

#### Copy, paste, bookmark

	:xmy	Move line x below line y.
	:x,ymz	Moves lines between and including ${\tt x}$ and ${\tt y}$ below line
		z.
	:xty	Copy line x below line y.
	:x,ytz	Copy lines between and including ${\tt x}$ and ${\tt y}$ below line
		z.
	ma	Set bookmark at current line. $a \in [a-z]$ .
	'a	Jump to bookmark a.
	:'a,'bco'c	Copy lines between and including bookmarks a and b
		below bookmark c.
	:'a,'bco'z	Copy lines between and including bookmarks a and b
		below line z.

Default settings: Set default settings in /.vimrc

Create this file if it does not exist.

Example .vimrc file:

syntax on colorscheme desert set number set hls

### 9. Markdown

#### Text formatting:

- \*italics\*
- \*\*bold\*\*
- \*\*\* bold italics \*\*\*
- \_\_underline\_\_
- \_\_\*underline italics\*\_\_
- \_\_\*\*underline bold\*\*\_\_
- \_\_\*\*\*underline bold italics\*\*\*\_\_
- ~~strikethrough~
- Text coloring:

<span style="color:blue"> blue text </span>

#### Heading, lists and links

- Itemized list: \* item 1 or + item 1 or item 1
- Ordered list: Eg:
- 1. red
- 2. blue
- 4. green # Here output automatically numbers it to 3
- Use # for Headers.
- # Header level 1
- ## Header level 2

Markdown supports upto 6 levels.

- <http://website.com/link>
- [link text](http://website.com/link)
- Insert figure

![alt text](path/to/figure.png/)

#### Inserting code

- 'inline code', Use backticks.
- Code block with tilde:
- ~~~ Language (Optional used by pandoc to ) code block code block
- Codeblock with three backticks:
- ""Language (Optional used by pandoc to ) code block code block

### 10. Pandoc

- Markdown to HTML (simple version)

  \$ pandoc -f markdown -t html README.md -o README.html
- md to word
   pandoc -s README.md -o README.docx
- Standalone: -s. Necessary for syntax highlighting.
  To get list of languages: --list-highlight-languages

- Box/shading for code: Use --highlight-style. Eg:
  --highlight-style tango # Good for light shade.
  --highlight-style breezedark # Good for dark shade.
- --list-highlight-style # List of highlight themes.

### 11. Uncategorized

#### Terminal shortcuts

ctrl	+ [	W	Delete from cursor to beginning of word.
ctrl	+	U	Delete from current cursor to start of line.

 $\boxed{\mathsf{ctrl}} + \boxed{\mathsf{A}}$  Move cursor to beginning of line.

ctrl + E Move cursor to end of line. ctrl + L Clear the screen.

alt + F Move forward by word.

alt + B Move backward by word.

### 12. WSL and windows CMD

# 12.1. Execute command prompt commands from WSL.

 Notepad: notepad.exe notepad.exe temp.txt

• File explorer: explorer.exe explorer.exe .

Execute command prompt commands in WSL.
 cmd.exe command-line-commands Eg: Opening a windows program
 cmd.exe /C start program\_name file\_name
 Eg:
 cmd.exe /C start SumatraPDF.exe
 mementopython3-english.pdf

### 12.2. Open from command prompt

Websites using edge or chrome.
 Edge: start microsoft-edge
 Edge: start microsoft-edge:http://www.google.co.in/

- MS-office apps.
- Other applications.

### 13. Using GUI in WSL

### 13.1. Installing XFCE

#### Under construction

#### Ref:

https://www.youtube.com/watch?v=nKCe9UE-quA https://www.shogan.co.uk/how-tos/wsl2-gui-x-server-using-vcxsrv/

#### 13.2. Running XFCE

#### Open XLaunch app

The following is just to open a windows with simple settings.

- 1. Doulble-click and open XLaunch app. You will see a dialog box for display settings.
- 2. Choose "One large window" and choose "-1" for Display Number. Click "Next".
- 3. Choose "Start no client". Click "Next".
- Check "Clipboard", "Primary Selection", and "Native opengl". Click "Next".
- 5. Save the configuration if you want, or just click "Finish" to start the window.

#### Launch xfce in WSL

Execute the command xfce4-session. Ignore the warnings.

## 14. Incomplete:

NOTE: This cheatsheet does not include Bioconductor and GRanges. Ver2 has them. But I will split it to a different cheatsheet, "Bioconductor and R"

- arithmetics in bash
- pandoc
- markdown syntax
- install packages
- $\bullet$  make
- $\bullet$  tabix
- $\bullet$  SQL
